Description

Nucleic acids and chimeric genes for increasing seed lysine content - comprise sequence encoding all or part of lysine ketoglutarate reductase, useful to improve nutritional quality of seeds from This is the amino acid sequence of a maize near full-length Claim 2; Page 189-191; 231pp; English transformed plants the chimeric gene.

Lins is the amino acid sequence of Arabidopsis thaliana (SDH), as deduced from a sequence (LKR)/Saccharopine dehydrogenase (SDH), as deduced from a gene (see AAV99599) isolated from a CD4-8 Land8berg erecta genomic library. The protein lacks an N-terminal cargetting sequence suggesting that the lysine degradative cargetting sequences used fragments comprising balant cell cytosol.

Isolated nucleic acid fragments comprising sequences encoding all chimeric gene comprising the fragment (or a subfragment) operably gene reduces LKR activity in plant seeds transformed with it; (2) and tells and seeds in which LKR activity is reduced due to a nutable seed specific regulator, where the chimeric gene reduces LKR activity in plant seeds transformed to an until the comprising in the gene encoding LKR activity is reduced due to a character gene; (3) a nucleic acid fragment comprising; (1) chimeric acid fragment comprising; (1) chimeric acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) cubstantially insensitive to lysine inhibition is operably linked seed specific regulatory sequence and to a plant component transity sequence and to a plant component transity sequence and to a plant component (1) and (11), especially as fragment of (2); and (5) seeds seed specific regulatory sequence; (4) plants comprising in genome (1) and (11), especially as fragment of (2); and (5) seeds with reduction may be used to produce plant cells corn, soybean, rapeseed, wheat and rice (claimed). LKR is LKR activity reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR.
                                                                                                                                                                                                                                                                                                                                                       is the amino acid sequence of Arabidopsis thaliana
                                                                                                                                                                                Claim 2; Page 175-178; 231pp; English.

                                                                                               This is the amino acid sequence of a maize lygine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDH) partial polyeptide. It was deduced from cDNA (see AAV99564) obtained from developing seed mRNA by PCR and RACE. Isolated nucleic acids comprising sequences encoding all or part of plant LKR enzymes are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a seed specific regulator, where the chimeric gene reduces LKR activity in plant

seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene; (3) a nucleic acid fragment comprising; (i) chimeric gene above, and (ii) a second chimeric gene; (i) which a nucleic acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) substantially insensitive to lyshine inhibition is operably linked to a plant chloroplast transit sequence and to a operably linked to a plant chloroplast transit sequence and to a command of the seed specific regulatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells can seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapesed, wheat and rice (claimed). LKR is corn, soybean, rapesed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. Israment, preparing a chimeric gene for cosuppression of LKR, the chaimed the chaimed transforming plants with

Nucleic acid fragments comprising sequences encoding all or part of plant LKR polypeptides are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a suitable seed specific regulator, where the chimeric gene reduces LKR activity in plant seeds transformed with it: (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene; (3) a nucleic acid fragment comprising; (1) chimeric gene above, and (ii) a second chimeric gene, in which a nucleic acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chhoroplast transit sequence and to a spant seed specific regulatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells

and seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR is important in controlling free lysine accumulation in plant seeds. LKR activity reduction may be achieved by cloning the claimed fragment, preparing a chimeric gene for cosuppression of LKR, expression of antisense RNA for LKR, and transforming plants with

The invention relates to invertebrate enzymes and nucleic acids, including lysine-ketoglutarate reductase/saccharopine dehydrogenese (LKK/SDH) and peptidyl-alpha-hydroxyglycine alpha-amidating lyase (PAL) from Drosophila metanogaster, designated dmLKR/SDH, dmPAL and dmPAL2. The enzymes are useful for detecting a candidate compound especially a putative pesticidal or pharmaceutical agent that interacts with an invertebrate enzyme or its fragment. The identified compound is useful corrected to capress the enzyme are useful for studying invertebrate enzyme activity and for identification and screening of newtrebrate enzyme activity and for identification and screening of newtrebrate enzyme activity and for identification and screening of pesticide targets directed to components of a pathway involving a subject protein. Nucleic acids encoding the invertebrate enzymes or their fragments are useful as biopesticides. The enzymes and thair DNA are useful for genetically modifying metazoan invertebrate enzymes or their fragments are useful as biopesticides. The enzymes and thair DNA are useful for genetically modifying metazoan invertebrate organisms, such as insects and worms or cultured cells, resulting in expression or mis expression of the protein. The organisms or cultured cells are useful in identification of new drug targets, therapeutic agents, diagnostics and enzyme levels and/or lunction, e.g. disorders associated with abnormal enzyme levels and/or lunction, e.g. disorders associated with babormal enzyme levels and protein. LKR/SDH is a principal enzyme in the catabolism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel invertebrate enzymes and nucleic acid encoding the enzyme useful as targets for pesticides and to identify compounds that have utility as therapeutics or pesticides \cdot

                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.lnt/pub/published_pct_sequences.
                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins

This is the amino acid sequence of a rice lysine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDH) partial polyeptide. It was deduced from CDNA (see AAVY9555) obtained from CC an EST database search. Isolated nucleic acid fragments comprising sequences encoding all or part of plant LKR enzymes are new. Also claimed are: (1) a chimeric gene comprising the fragment (or a subfragment) operably linked to a seed specific requilator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR critisty is reduced due to a mutation in the gene encoding LKR critisty is reduced due to a mutation in the gene encoding LKR critisty is reduced due to a mutation in the gene encoding LKR comprising: (i) chimeric gene, and (ii) a second chimeric gene, in which a nucleic acid fragment encoding dihydroxopiciolinic acid fragment encoding dihydroxopiciolinic acid soperably linked to a plant chloroplast transit sequence and to a plant seed specific requlatory sequence; (4) plants comprising in genome (i) and (ii), especially as fragment of (2); and (5) seeds from (3). The chimeric genes can be used to produce plant cells and seeds with reduced LKR activity, especially and reduced LKR activity, es
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      736 SGKNPAVYKFLGETIHVDGHNLYESAKRLRLRELPAFALEHLPNRNSLIYGDLYGISKEA 795

```
This is the amino acid sequence of a wheat lysine ketoglutarate reductase (LKR) or saccharopine dehydrogenase (SDH) partial polyeptide. It was deduced from cDNA (see AAV99567) obtained from an EST database search. Isolated nucleic acid fragments comprising sequences encoding all or part of plant LKR enzymes are new. Also claimed are: (1) a chimeric gene comprising the fragment) operably linked to a seed specific requilator, where the chimeric gene reduces LKR activity in plant seeds transformed with it; (2) plant cells and seeds in which LKR activity is reduced due to a mutation in the gene encoding LKR or transformation with the chimeric gene; (3) a nucleic acid fragment comprising; (i) chimeric gene above, and (ii) a second chimeric gene, in which a nucleic acid fragment encoding dihydrodipicolinic acid synthase (DHDPS) substantially insensitive to lysine inhibition is operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence; (4) plants comprising in plant seed-specific regulatory sequence; (4) plants comprising in seeds with reduced LKR activity, especially in Arabidopsis, corn, soybean, rapeseed, wheat and rice (claimed). LKR activity reduced LKR activity, especially in Rabidopsis, important in controlling free lysine accumulation in plant seeds. LKR activity required by an element of the controlling free lysine accumulation in plant seeds. LKR activity required by an element of the controlling free lysine accumulation of the claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               940 YPDGQPAEKHQATLLEFGKVENGRSTTAMALTVGIPAAIGALLLLKNKVQTKGVIRPLQP 999

                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a protein homologous to fungal saccharopine dehydrogenases. The specification describes a Corynebacterium dapA gene, which encodes a dihydrodipicolinic acid synthase (PHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chloroplast transit sequence and to a plant seed specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean (Glycine max).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   948 KHQATLLEFGKVENGRSTTAMALTVGIPAAIGALLLLKNKVQTKGVIRPLQPEIYVPALE 1007

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a protein homologous to fungal saccharopine dehydrogenases. The specification describes a Corymebacterium dapA gene, which encodes a dihydrodipicolinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean (Glycine max).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 526 KIGKVNEYETDVTIDKGGPK-----ILILGAGRVCRPAAEFLASYPDICT-----YG 572
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chimeric genes encoding lysine production enzymes - useful for increasing transgenic seed lysine content without being inhibited by high levels of the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
